

NEW E-BOOK: SOLAR FLARES

The Inner and Outer Effects

September 11, 2012

By Michael Erlewine (Michael@Erlewine.net)

We have had at least one M-class solar flare (or close to it) each of the last several days. I have put together a second free e-book (32 pages) on solar activity that gives you an overview of solar flares, CME events, and their possible effect on us mentally, physically, and spiritually. It is more compact than my larger book "Sun Storms." I also covers some commonly asked questions like "What is astrology?," and so forth. I include here a few excerpts from "Solar Flares" below.

If you would like to download a copy of Solar Flares, the book is listed here.

Excerpt from "Solar Flares":

PREDICTIVE ASTROLOGY

The popular idea that astrology can predict future events needs to be addressed. Astrology 'can' predict future events, but probably not quite as you imagine. Here is how that works:

Astronomers predict when astronomical events like planetary conjunctions, New Moons, etc. will occur. This is a science. And astrologers attempt to interpret these events and tell us what they might mean.

If the astronomical event is still in the future 'and' astrologers can interpret it, then astrology can predict the future, but in no other way that I know of. Psychics and seers like Nostradamus may predict non-astronomical events, like catastrophes, the stock market, etc., but not astrologers. And some astrologers are psychic, so that tends to confuse the issue. Astrology is the interpretation of astronomical (scientific) events, plain and simple, and not psychism. We need to note the difference.

A SYNCHRONOUS DANCE

The endless patterns that the Sun, Moon, and planets make in the heavens are like a vast kaleidoscope, a cosmic dance, and those of us here on Earth play an integral part. We are dancing too and the astronomical events are just a way of describing our own experience. I say 'our own' experience because I don't accept the idea that humankind is an simply an anomaly in the universe, a tiny lonely planet orbiting a small star at the far edge of the distant Milky Way galaxy. How melancholy is that? Quite to the contrary; we are a full-fledged legitimate representative of the galaxy, the solar system, and Earth. We are an equal part of intelligent life

in the cosmos, so to speak. This is our cosmic bill of rights.

It is not just that we are looking from Earth out at the Sun and the stars, but rather we (as the intelligence of the Sun and the stars) are looking at ourselves (and life) through Earthly eyes. In other words, we already are the intelligent life that we keep looking outside in the heavens to find.

I just flip the 20th-Century view of our being a lonely anomaly in a dark, cold universe. It seems to me that we 'are' the intelligent life, the spaceman or 'aliens' we have been craning our necks through telescopes for years hoping to find. We are already (and have always been) out there in space, born of space, children of the galaxy, and especially children of the Sun. *Fait accompli*. That is my view. We are no stranger in a strange land here, except maybe to our own self, but that can be remedied. 20th-Century science has us looking through the wrong end of the telescope, so to speak, and in their eyes we seem so small, when in fact we are average or at least an equal part of the universe, which is and always has been our home. It is not like we came from somewhere else other than this universe. Where would that be? We are perfectly normal representatives of the intelligent life in the universe, not an anomaly or accident, somehow lost in space. We are an equal partner in all this.
